NATURAL RESOURCES

Total Maximum Daily Load Information Sheet

Straight Fork

Water Body ID: 959

Water Body Segment at a Glance:

County: Morgan
Nearby City: Versailles
Length: 6 miles
Pollutant: Low dissolved oxygen
Source: Versailles Wastewater Treatment Facility

Schedule for TMDL development:

TMDL development schedules are subject to change.

The most current schedule for TMDL development is available on the department's website at dnr.mo.gov/env/wpp/tmdl/wpc-tmdl-progress.htm

Other TMDLs:

On Dec. 11, 2006, the U.S. Environmental Protection Agency approved a permit-in-lieu of a TMDL to address impairments due to volatile suspended solids. Permit No. MO-0094927 was issued to the Versailles Wastewater Treatment Facility with limits for total suspended solids to address this impairment. On Dec. 5, 2013, EPA approved modifications to this permit to address impairments due to chloride.

Description of the Problem

A water body is considered impaired when it fails to meet applicable water quality standards. Water quality standards consist of designated uses, water quality criteria, an antidegradation policy and implementation procedures. Straight Fork is impaired due to exceedances of state water quality criteria that protect aquatic life designated uses.

Designated uses of Straight Fork*

- Warm Water Habitat (WWH)
- Whole Body Contact Recreation Category B (WBC-B)
- Secondary Contact Recreation (SCR)
- Human Health Protection (HHP)
- Irrigation (IRR)
- Livestock and Wildlife Protection (LWP)

* In addition to these specific uses, all waters of the state are protected by the general water quality criteria that are specified in the state's Water Quality Standards at 10 CSR 20-7.031(4).

Designated Uses that are Impaired

- Warm Water Habitat (WWH)
- General Criteria

Standards that apply

- In Missouri Water Quality Standards at 10 CSR 20-7.031 Table A, the criterion for dissolved oxygen in streams is a minimum of 5 mg/L. Dissolved oxygen is important as many aquatic organisms require high levels of oxygen to survive. A water body is judged to be impaired due to low dissolved oxygen if more than 10 percent of measurements in a water body fall below the water quality criterion. In the case of Straight Fork, 14 of 34 samples (41 percent) did not meet the water quality criteria of 5 mg/L (Figure 1).

Figure 1. Dissolved oxygen data for Straight Fork (2003 – 2011)

TMDL for Straight Fork

The Straight Fork TMDL will calculate the maximum amount of each listed pollutant that the stream can receive and still meet water quality standards. The TMDL will also identify all potential or suspected pollutant sources in the watershed and distribute the allowable pollutant loads among those various sources. When developed, the Straight Fork TMDL will use the most current and available data. For this reason, the final TMDL may present information that differs from that contained in this information sheet.
